$$A = \begin{bmatrix} P_j & F_a \\ G_j & P_a \end{bmatrix}$$
 where:
$$G_j = \text{Probability of a juvenile growing into the adult class}$$

 P_i = Probability of a juvenile survival without transitioning into adulthood and:

d:
$$G_j = S_j \times \gamma_j$$

$$P_j = S_j \times (1 - \gamma_j)$$

$${S_j \choose j} 2$$

$$G_{j} = S_{j} \times \gamma_{j}$$

$$P_{j} = S_{j} \times (1 - \gamma_{j})$$

$$\gamma_{j} = \frac{\left(\frac{S_{j}}{\lambda}\right)^{2}}{1 + \left(\frac{S_{j}}{\lambda}\right) + \left(\frac{S_{j}}{\lambda}\right)^{2}}$$

where:

$$\lambda$$
 = Dominant eigenvalue for the Leslie matrix defined above γ_i = Proportion of surviving juveniles transitioning into adulthood
